SUMMARY

Junior software engineer with a knack for creative problem solving and collaborative team work. My previous career of 5 years as a commercial carpenter coincides and overlaps with the tech industry because they both require objective thinking and a concerted effort by all involved to complete a given task. My coworkers would describe me as extremely reliable.

EXPERIENCE

- Currently volunteering at UnderDog Dev as a "Mentee Shepherd" where I'm tasked with ushering in new members both 'Mentee' and 'Mentor' into the UnderDog slack group community and updating records to reflect their level of participation within the community.
- **City Weather Checker:** A React framework app that takes the input of a city, makes an API call and returns today's date, degrees in Fahrenheit, and the weather (cloudy, rainy, sunny, snow).
- **To-Do-List:** A React framework app that creates a list from what is typed into the input field. The task can be deleted or edited at the user's leisure. Tailwind is used for the styling. Firebase's Firestore Database, Authentication and Hosting is used on the back-end.
- **Scrabble Cheater:** A Express 'REST' API app that takes a string of random letters and returns a list of all valid scrabble words along with the added score of each scrabble tile. Tailwind is used for the styling. Axios and JQuery are used on the front end.

EDUCATION / TRAINING

- **UnderDogDev:** A rigorous 3 month coding bootcamp that provides a multitude of resources including five personal mentors that specialize in a broad range of tech industry expertise.
- **Wayne Community College:** Intro to web development classes where I learned the basic skills of HTML and CSS along with the theoretical understanding of HTTP protocols.
